In February 2019, the U.S. federal government updated national HIV goals to end the epidemic in the United States by 2030.

Nationally, this positive trend has not been true for Hispanics/Latinos.

As a result, Hispanic/Latinos access HIV prevention and treatment services at low rates. Why Does Any of This Matter?

There are a number of underlying drivers of the HIV epidemic in Hispanic/Latino communities

Within the U.S. Hispanic/Latino community, key populations are particularly affected by the accelerating HIV epidemic.

Today, 1 in 5 U.S. are Hispanic/Latino

The U.S. Hispanic/Latino population is double in size by 2060

Hispanic/Latinos account for roughly 13-24% of HIV-positive Hispanic/Latinos

In recent years, there has been significant updated national HIV goals to address the epidemic in the United States.
